

Keysight 86120B, 86120C, 86122C Multi-Wavelength Meters

Data Sheet

Introduction

The 8612xx family of multi-wavelength meters is known for reliability and durability on the manufacturing floor, on engineer's benches, and it is robust enough to be installed on ships. Statistical data from a large share of the industry's installed wavelength meters enables Keysight Technologies, Inc. to continuously fine-tune its instruments for lower cost of ownership and longer usage. Current updates include an extended recommended re-calibration period of two years and a doubled lifetime of the built-in reference laser. The 86122C multi-wavelength meter includes five years, the 86120B and 86120C three years of warranty without additional cost. The warranty covers not only the reference laser, but all opto-mechanical and electronic parts.

NEW Fast Update Option for the 86122C Multi-Wavelength Meter

Our flagship model, the Keysight 86122C, is now available with a faster update rate. The new option 86122C-110 accelerates the update rate from 2 per second to 3 per second. The measurement cycle time is reduced from 0.5 seconds to 0.3 seconds. For compatibility, the previous update rate is still available under option 86122C-100.

Keysight multi-wavelength meters are Michelson interferometer-based instruments that measure wavelength and optical power of laser light over a specified wavelength range. Simultaneous measurements of multiple laser lines are performed allowing measurements of DWDM signals and multiple lines of Fabry-Perot lasers. Each laser line is assumed to have a linewidth (including modulation sidebands) of less than:

- 10 GHz for the 86120B,
- 5 GHz for the 86120C and
- 2.5 GHz for the 86122C

This technical specifications sheet describes the measurement accuracy and operating conditions of the Keysight 86120B, 86120C and 86122C Multi-Wavelength Meters. The specifications apply to all functions within the specified environmental conditions. All specifications apply after the instrument's temperature has been stabilized after 15 minutes continuous operation, and when the instrument is in NORMAL UPDATE mode (86120B and 86120C).

Definitions of Terms

Characteristics and specifications

The distinction between specifications and characteristics is described as follows:

- Specifications describe warranted performance.
- Characteristics provide useful, but non-warranted information about the functions and performance of the instrument.
- General Characteristics give additional information for using the instrument. These are general descriptive terms that do not imply a level of performance.

Wavelength

- Range refers to the allowable wavelength range of the optical input signal.
- Absolute accuracy indicates the maximum wavelength error over the allowed environmental conditions.
- Differential accuracy indicates the maximum wavelength error in measuring the wavelength difference between two signals that are simultaneously present.
- Minimum resolvable separation indicates the minimum wavelength separation of two laser lines input required to measure each wavelength simultaneously. Two laser lines closer in wavelength than the minimum resolvable separation are not resolved and one average wavelength is displayed.
- Display resolution indicates the minimum incremental change in displayed wavelength.

Power

- Calibration accuracy indicates the maximum power calibration error at the specified wavelengths over the allowed environmental conditions.
- Flatness refers to the maximum amplitude error in a measurement between two lines that are separated in wavelength by no more than the specified amount.
- Linearity indicates the maximum power error in measuring the change in power of one laser line.
- Polarization dependence indicates the maximum displayed power variation as the polarization of the input signal is varied.
- Display resolution indicates the minimum incremental change in displayed power.

Sensitivity

Sensitivity is defined as the minimum power level of a single laser line input to measure wavelength and power accurately. A laser line with less than the minimum power may be measured but with reduced wavelength and power accuracy. For multiple laser lines input, sensitivity may be limited by total input power.

Selectivity

Selectivity indicates the ability to measure the wavelength and power of a weak laser line in the proximity of a specified stronger laser line and separated by the specified amount.

Input power

- Maximum displayed level indicates the maximum total input power (total of all laser lines present) to accurately measure wavelength and power.
- Maximum safe input power indicates the maximum total input power (total of all laser lines present) to avoid permanent optical damage to the instrument.

Maximum number of lines input

Maximum number of lines input is the maximum number of displayed lines. If more than the specified number of lines is input, only the longest wavelength lines are displayed.

Input return loss

Input return loss indicates the optical power reflected back to the user's fiber cable relative to the input power. It is limited by the return loss of the front panel connector, and assumes the user's connector is good.

Measurement cycle time

Measurement cycle time refers to the cycle time when measuring wavelength and power of laser lines. Specific advanced applications may require longer cycle times.

General Characteristics

The 8612x wavelength meters contain HeNe reference lasers, which have limited operating lifetimes, like all gas-discharge lasers. With the latest enhancement of the reference lasers used in the new 86122C, the average laser lifetime has doubled. Together with the 2-year recommended re-calibration period and the included 5-year warranty (3 years for 86120B, 86120C), this helps minimizing planned and unplanned downtimes and cost of ownership.
